

# Workshop

## EMDR & voice-hearing: a protocol for target selection

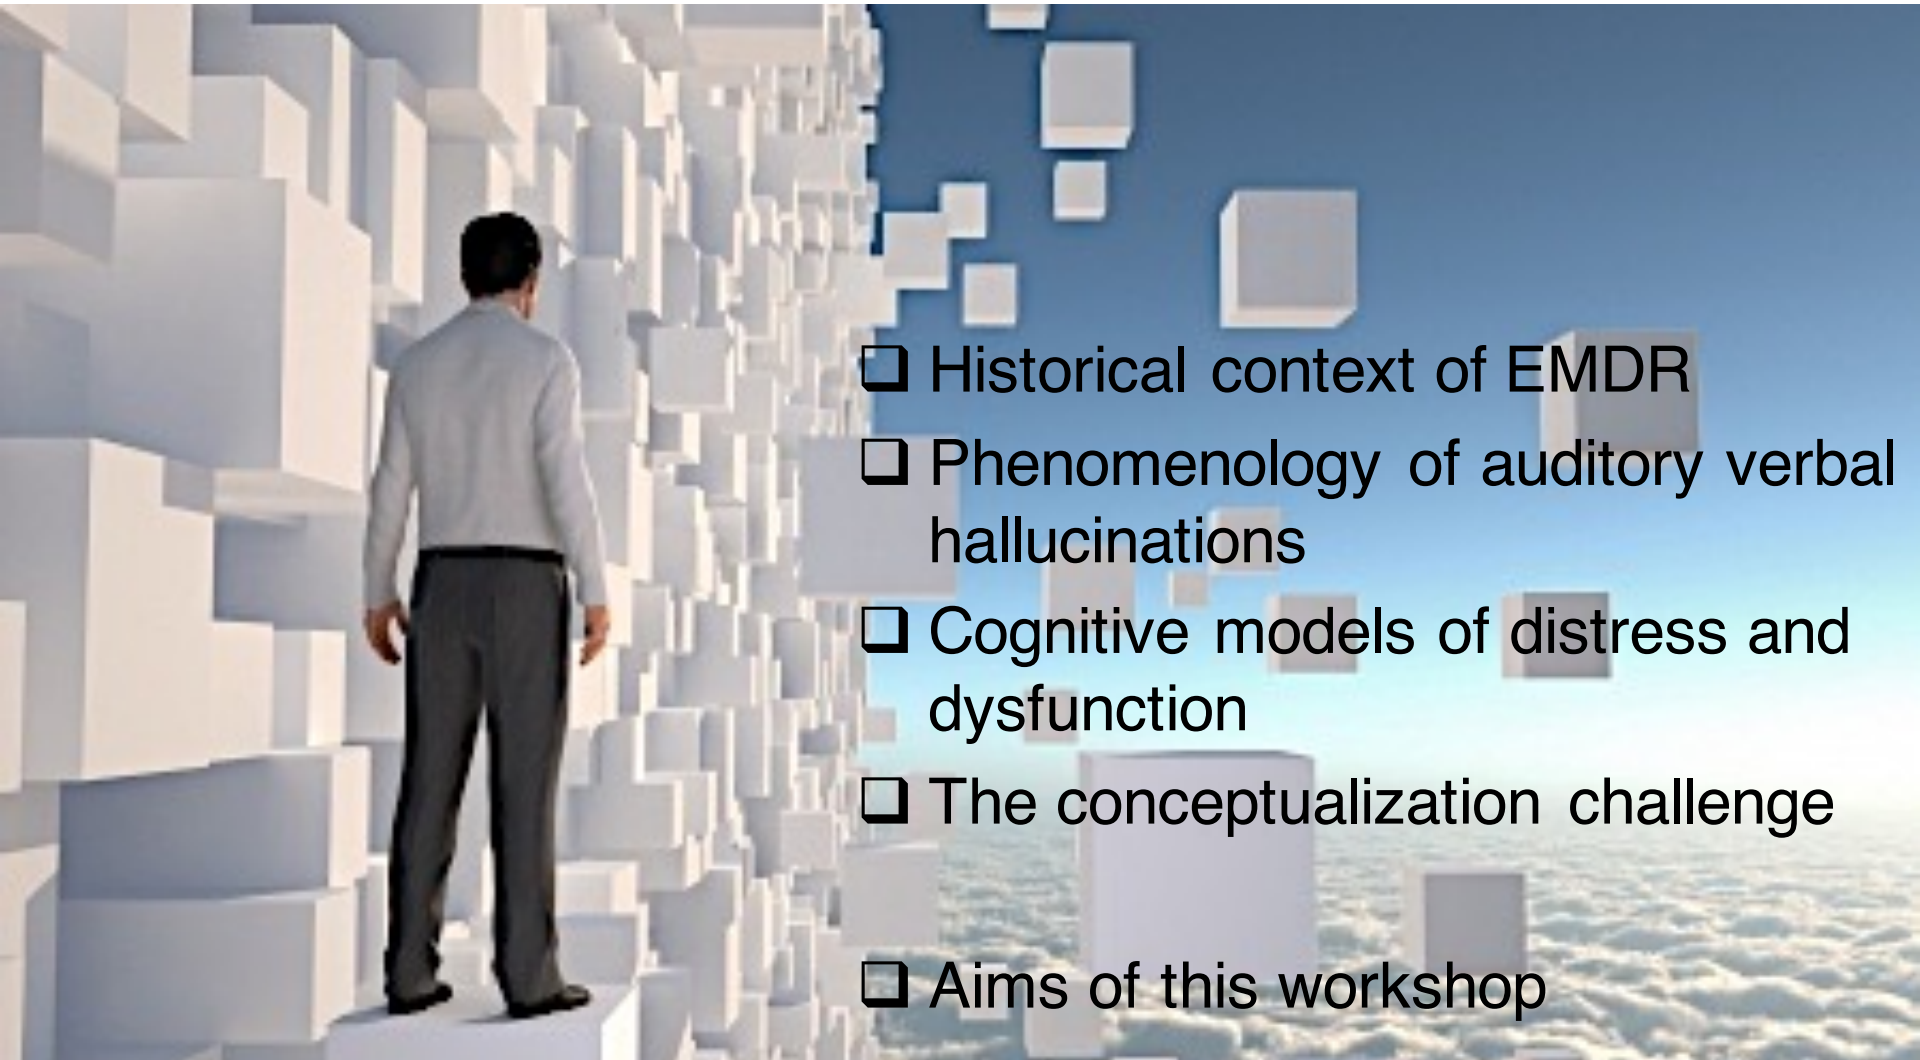

David van den Berg

Clinical psychologist,

Tineke van der Linden

Clinical Psychologist in training

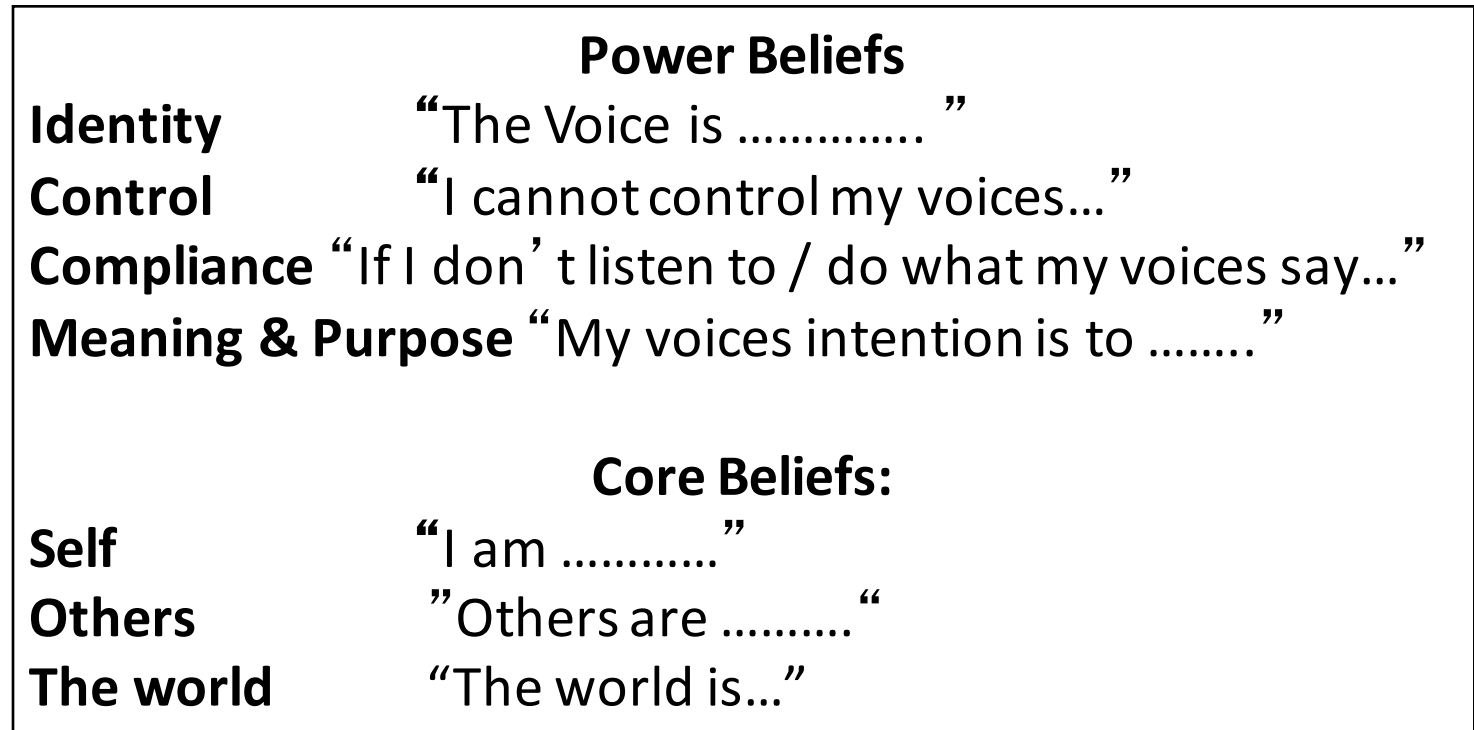

# EMDR in auditory verbal hallucinations

- ❑ Historical context of EMDR
- ❑ Phenomenology of auditory verbal hallucinations
- ❑ Cognitive models of distress and dysfunction
- ❑ The conceptualization challenge
- ❑ Aims of this workshop

# The Compliance Behaviour Cycle

**Voice  
Activity**

**Safety  
Behaviors  
Compliance**

**Emotional Consequences**  
Fear, Anxiety, Depression

# EMDR in auditory verbal hallucinations

- ☐ Historical context of EMDR
- ☐ Phenomenology of auditory verbal hallucinations
- ☐ Cognitive models of distress and dysfunction
- ☐ The conceptualization challenge
- ☐ Aims of this workshop

# Exercise

- Read the case description
- Discuss with your neighbour which targets you would select

*10 minutes*

# Case example: discussion

- Which targets would you select and why?

# Model for target selection

Inventarisation of voices

V

Inventarisation of trauma

V

Assessment of PTSD

V

Treatment of PTSD

# Model for target selection

Select voices & set goals

V

Direct target selection & desensitization

*Direct link to memories, imagery, flash forward*

V

First method target selection & desensitization

*temporal link to voices*

V

Second method target selection & desensitization

*Indirect thematic link to voices*

# Model for target selection:

## Select voices & set goals

Decide what (group of) voice(s) to work on:  
*Most distressing / most negative impact on functioning*

Set clear goals:  
*Reducing distress / improving social functioning*

# Model for target selection:

## Direct target selection & desensitization

*Direct link to memories, imagery, flash forward*

### Target memories and imagery:

- Memories with direct content associations
- Flash forwards
- Voice related imagery

# Model for target selection:

First method target selection & desensitization

*temporal link to voices*

Target memories:

- Negative events after which voice hearing started
- Negative events after which the voices worsened

# First method of conceptualisation

# Model for target selection:

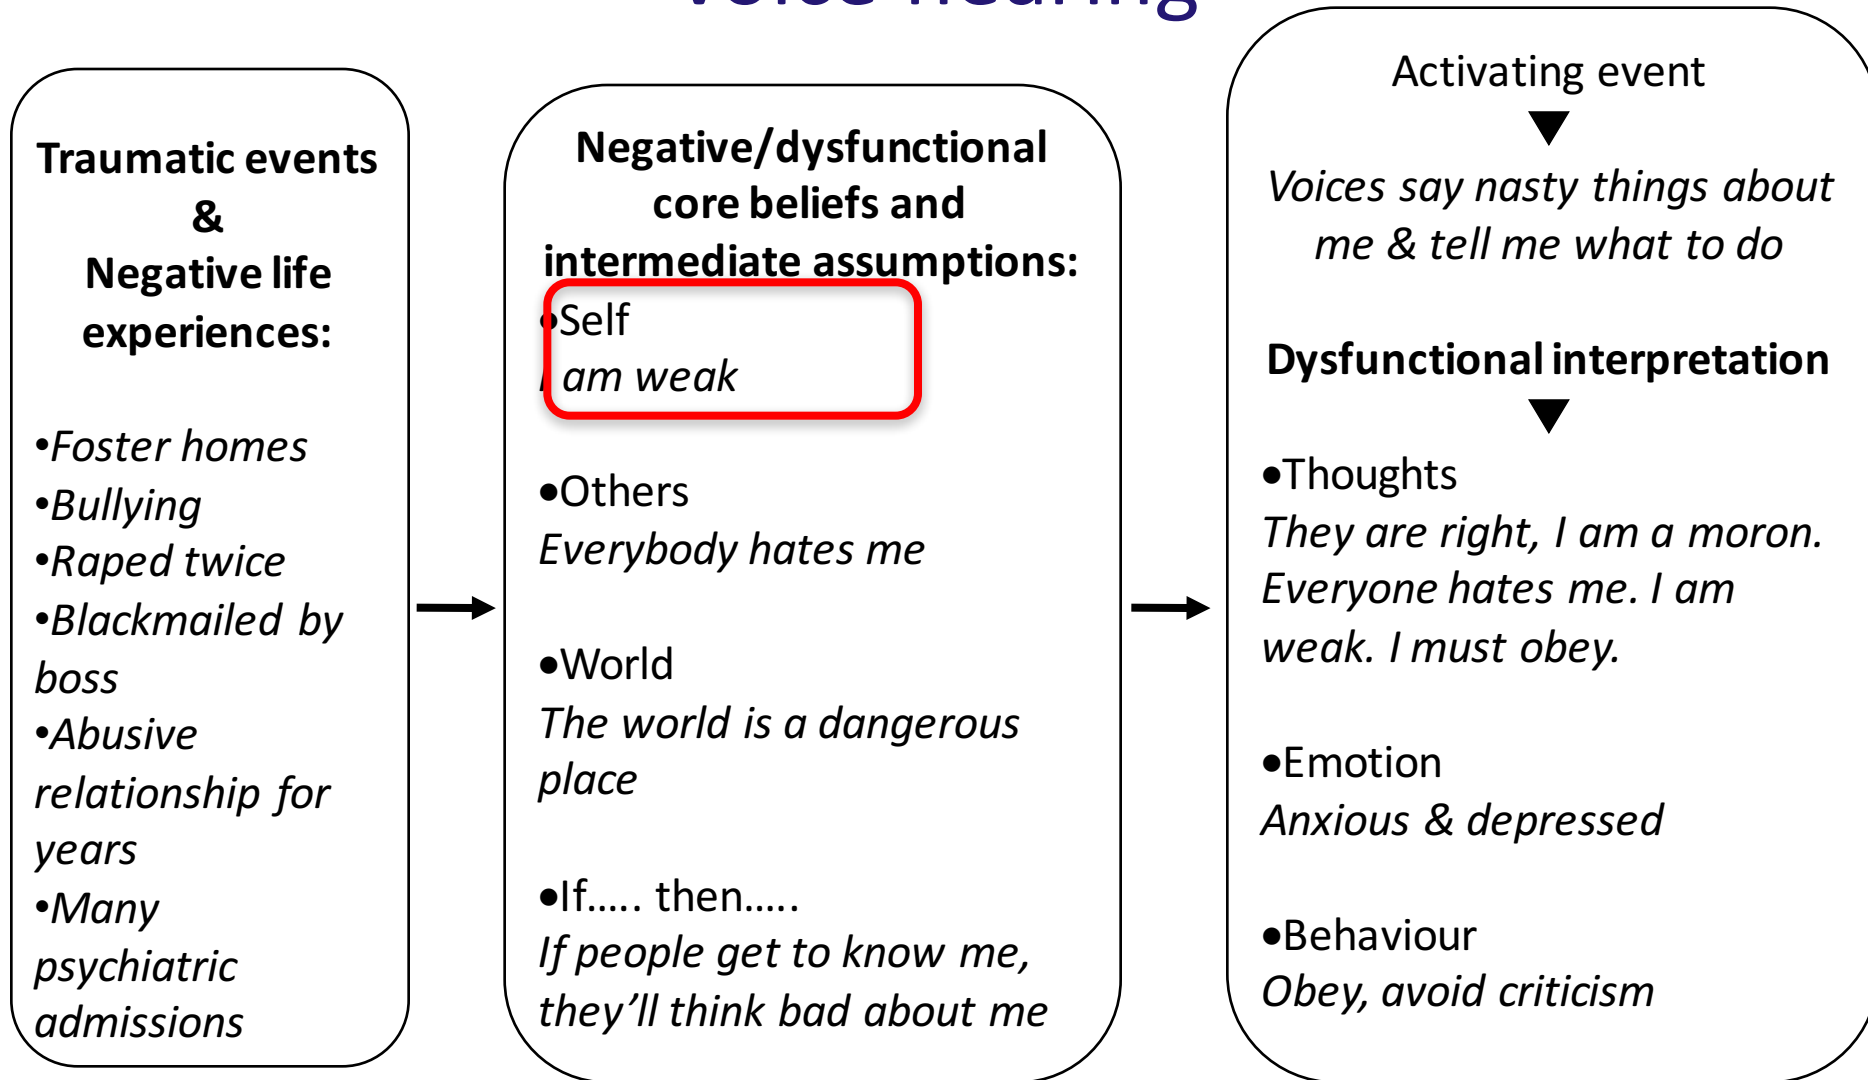

## Second method target selection & desensitization

*Indirect thematic link to voices*

Target memories:

- Negative experiences that resemble interaction with the voices
- Experiences that still proof negative self-beliefs triggered by the voices

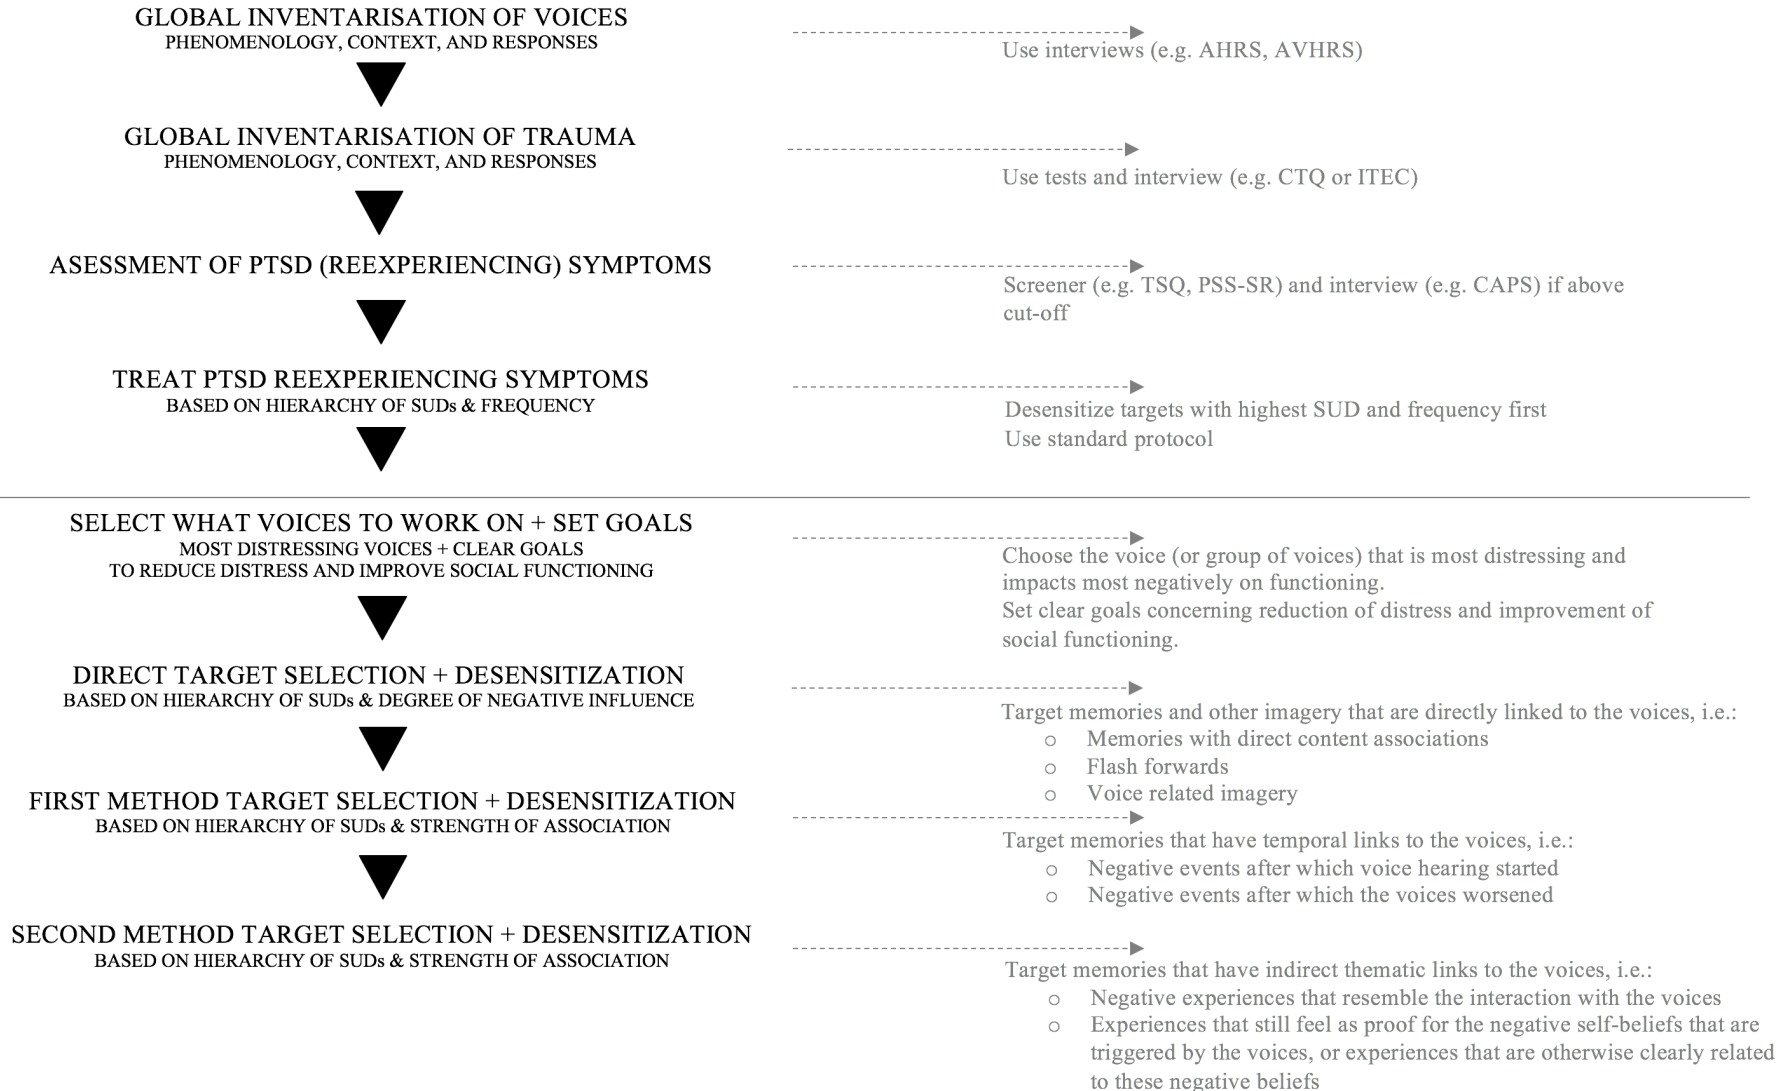

# Example of 2<sup>nd</sup> method case formulation in voice hearing

# Questions / feedback?

## EMDR FOR DISTRESSING VOICES A CONCEPTUALIZATION SCHEME

# How did it end with Mounire?

Description interview

# Take home message

- Voice-hearing has high complexity (therefore target selection also)
- EMDR promising in treatment of voice-hearing, but EMDR is not a stand-alone intervention
  - EMDR is safe

# Thank you for your attention!

# Program

Trauma & psychosis

Voice-hearing features

Case example

Practice: target selection

Discussion

Take home messages

# What this workshop is about:

- Some insights on voice-hearing, trauma & psychosis
- Practicing on a case example: target selection
- Discussion
- Model for target selection

## Goals:

- To transfer enthusiasm on EMDR in voice-hearing / psychosis
- Experience complexity
- Learn about the model

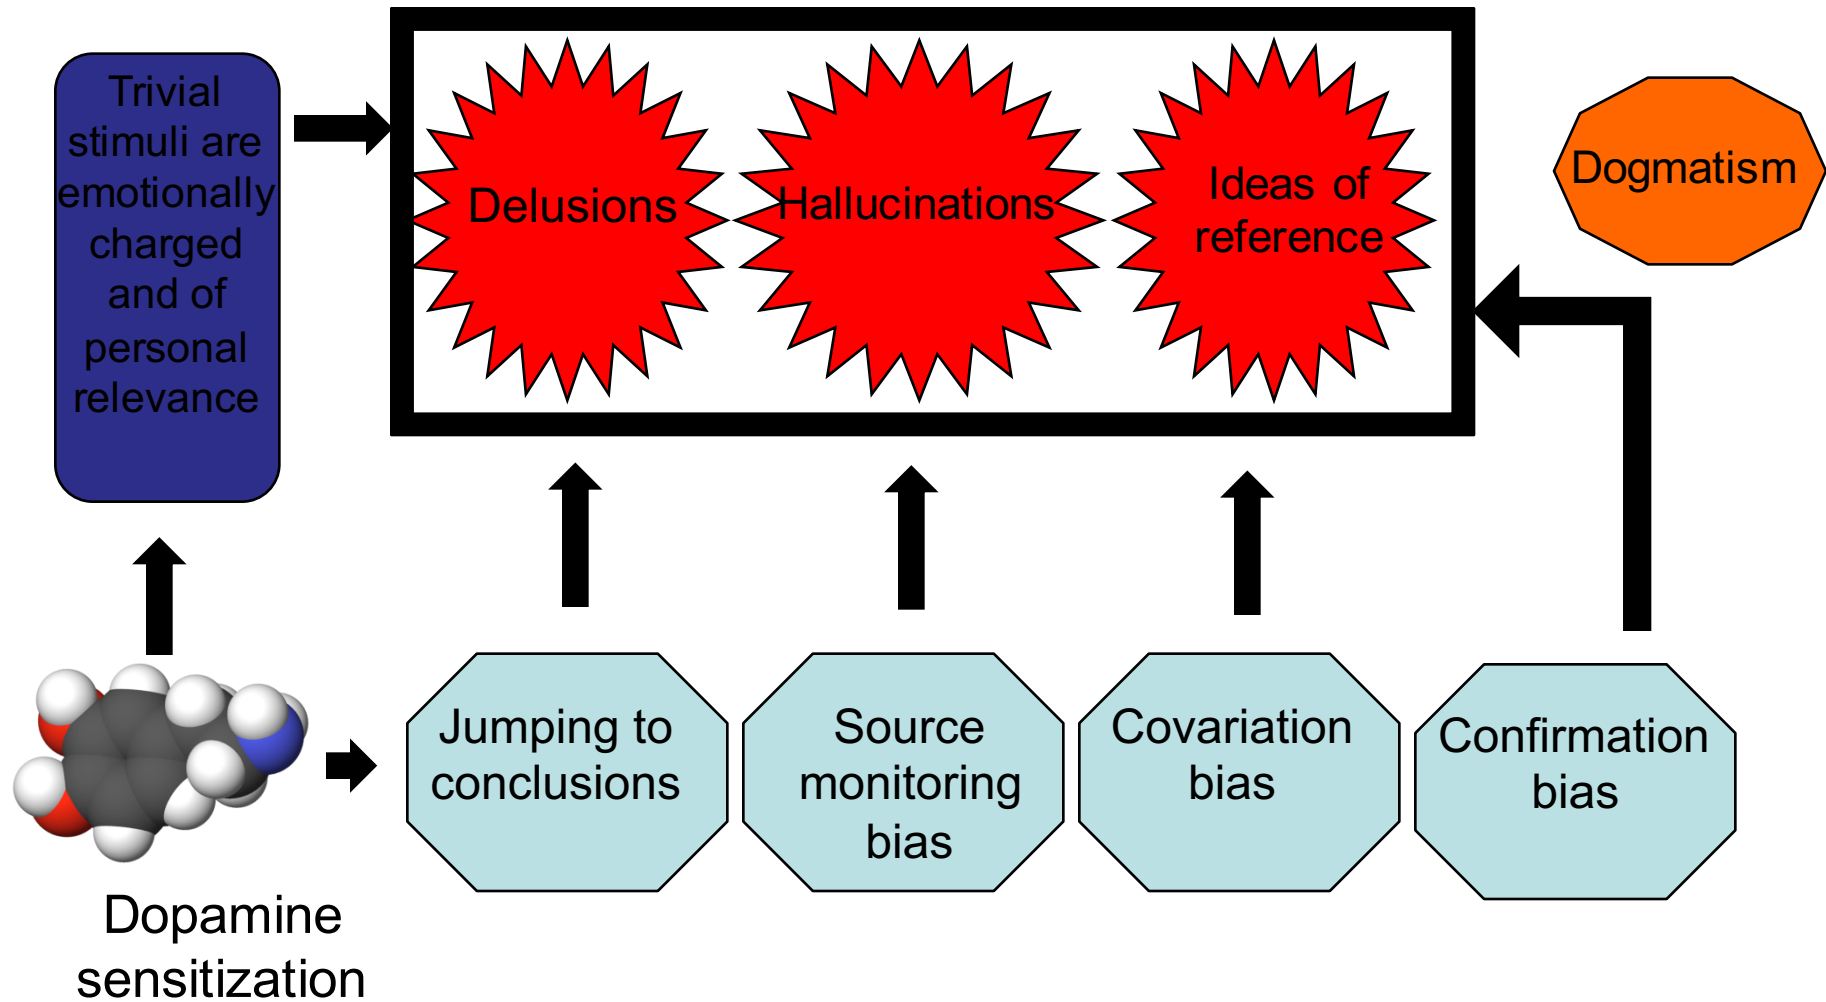

# Goal of treatment

- Always: less burden
- Never: less psychotic symptoms  
(might be a side effect)

# Trauma & psychosis

- The psychosis population is a multi trauma population.
- Trauma is an important risk factor for psychosis.
  - Direct route: trauma → onset / exacerbation
    - e.g. assault → (even more) paranoid thoughts
  - Indirect route: trauma → core beliefs → onset/continuation
    - e.g. CSA → “I am defenseless” → subjugation to voices  
“people are cruel” ↗
- PTSD is common; PTSD and psychosis negatively interact.
- Hallucinations and delusions quite often have features or themes that can be traced back to traumatic experiences.

# Cognitive biases and psychosis

# CBT insights on voice-hearing

## ■ compliance behaviour cycle:

Voices

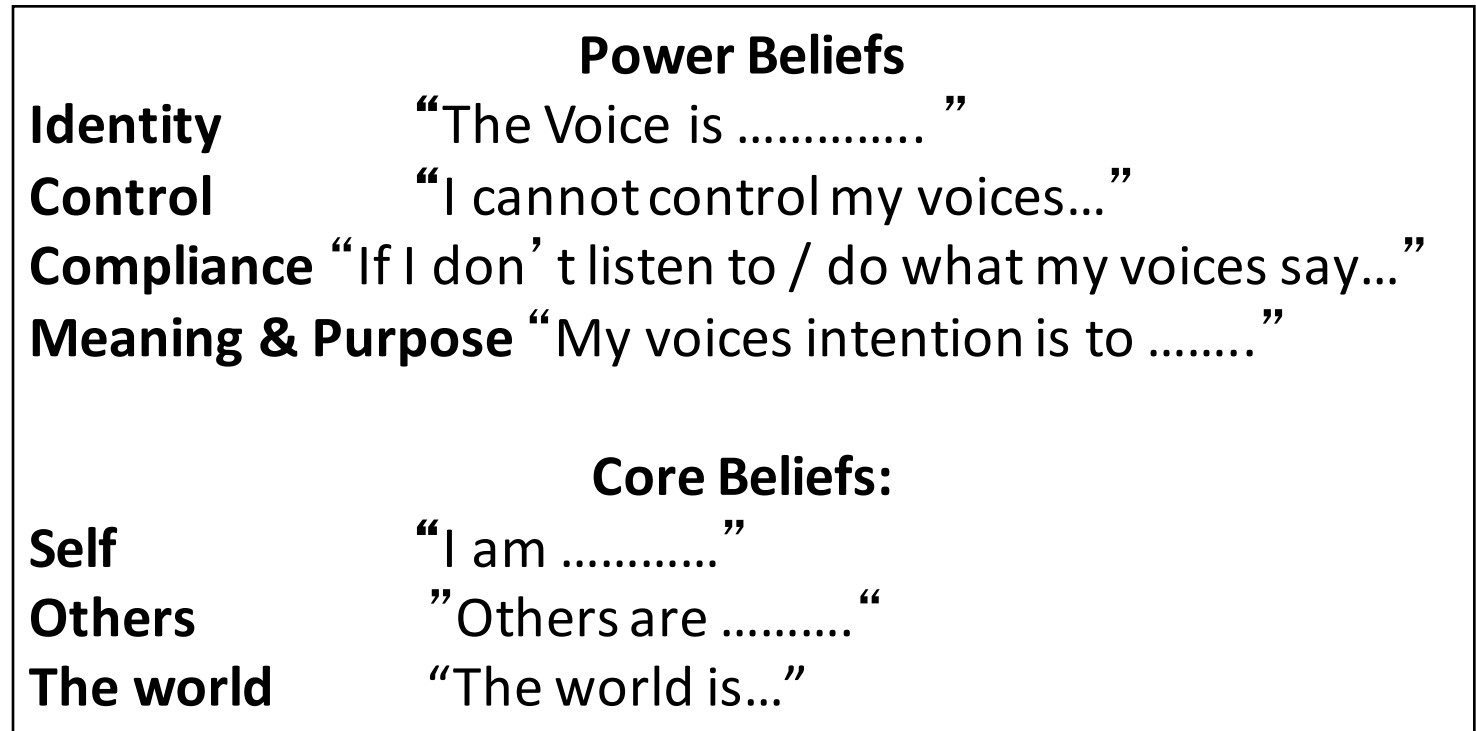

→ dysfunctional cognitions

(identity, benevolent/malignant, meaning/purpose, compliance, control, Self)

→ Dysfunctional/problematic behaviour

# The Compliance Behaviour Cycle

**Voice  
Activity**

**Safety  
Behaviors  
Compliance**

**Emotional Consequences**  
Fear, Anxiety, Depression
